```python
# This script prints a greeting and the user's name.

# Define a variable to store the name
name = "Saketh Ram"

# Create a greeting message using the name variable
greeting = "Hello, " + name + "! Welcome to Python programming."

# Print the greeting message to the console
print(greeting)
```

Explanation:

- Comments (# lines): Describe what each part of the code does, making it easier to understand.
- Variable (name): Stores the user's name.
- String concatenation (+): Combines the greeting text with the name.
- Print function (print()): Outputs the greeting message to the console.
